If you have a 471 capacitor of the same type, then clearly a 470 capacitor is not 470pF. If you have a 47 capacitor of the same type, then clearly 470 capacitors are not 47pF. You can make the same judgements if you have ...

Capacitors are fundamental electronic components used to store and release electrical energy. They consist of two conductive plates separated by a dielectric material, which enables them to manage energy and stabilize voltage in circuits. When a voltage is applied, the capacitor stores energy in the form of an electric field and discharges it ...

A capacitor is a passive electronic device that stores electric charge. Ceramic capacitors consist of two or more alternating layers of ceramic material as the dielectric and metal layers acting as the non-polarized electrodes.

An electrolytic capacitor is a type of polarized capacitor that uses a wet electrolytic solution and an oxide film to store electrical charge. An example is the aluminum electrolytic capacitor which contains two closely spaced spooled strips of aluminum foil ...
