

5 Commonly used energy storage charging piles

What are the different types of charging piles?

Charging piles are mainly divided into AC charging piles and DC charging piles. AC charging piles have a smaller body, are flexible for installation, and typically take 6-8 hours to fully charge. They are suitable for small electric vehicles and are commonly used in public parking lots, large shopping centers, and community garages.

What are electric car charging piles?

Electric car charging piles are fixed structures on the ground that provide AC electric energy for electric cars with on-board chargers using special charging interfaces and conduction modes. They have corresponding communication, charging, and safety protection functions. (How to Charge an EV imported from China)

Why is it important to maintain the charging pile?

The importance of maintaining charging piles lies in the fact that influences by the changeable environment and ageing inner parts can cause various faults. Regular examination and maintenance are necessary during both product storage and using processes.

What is a public charging pile?

Public charging piles are purchased by public service organizations such as government for use by any electric vehicle owner, such as public parking lots.

What is the difference between charging pile and charging stations?

1. Charging pile refers to a charging device with a charging gun and a human-machine interface, which is simply an electrical device that can be charged, either in one piece or in a split type.

How much does a charging pile cost?

The price of a charging pile can range from hundreds to thousands of RMB, with the main difference being in power. The cost of a 11KW charging pile is around 3000 RMB or more, a 7KW charging pile costs between 1500-2500 RMB, and a portable 3.5KW charging pile is priced under 1500 RMB.

5 Commonly used energy storage charging piles

Slow charging is a more commonly used charging method. For new energy electric vehicle charging piles, it is connected to the on-board charger, which mainly converts low-power AC into DC, which is often called AC-DC conversion. The charging power is generally 3kw or 7kw. The reason is that the power battery can only be charged with DC.
