SOLAR PRO. Application scenario design of large energy storage products

How can big data industrial parks improve energy storage business model?

Combined with the energy storage application scenarios of big data industrial parks, the collaborative modes among different entities are sorted out based on the zero-carbon target path, and the maximum economic value of the energy storage business model is brought into play through certain collaborative measures.

What factors influence the business model of energy storage?

The factors that influence the business model include peak-valley price difference, frequency modulation ratio of the market, as well as the investment cost of energy storage, so this paper will discuss from the following perspectives.

What is a power grid centric scenario?

As shown in Fig. 1,the power grid-centric scenario is a model of a grid center taking responsibility for zero carbon.

Does energy storage configuration maximize total profits?

On this basis, an optimal energy storage configuration model that maximizes total profits was established, and financial evaluation methods were used to analyze the corresponding business models.

What are energy storage capacity configuration schemes?

According to their characteristics, two energy storage capacity configuration schemes are set up, including local storage of surplus electricity and local balance of surplus electricity for Internet access.

What is load based SynErgy?

Load-based synergy is green energy use and elastic load is provided. Collaborative measures include improving load elasticity, reducing electricity consumption, and load fluctuation with the power supply. The synergy with energy storage as the main body is to balance supply and demand and improve power quality.

As large-scale renewable energy installations are connected to the grid, the variability and randomness of renewable energy increase the need for load balancing and frequency regulation [1,2,3].Meanwhile, the power adjustment capability and response speed of traditional energy sources are limited and cannot meet the demands of rapid regulation [4,5,6].

Typical application scenarios of energy storage on the power grid side mainly include self-absorption of new energy, smoothing of new energy output, frequency modulation ...
