What is battery thermal management?

Battery thermal management is required to regulate the temperature of the battery or battery pack into an appropriate range. Some thermal management methods, such as air cooling, liquid cooling, and heat pipe cooling, are developed to dissipate generated heat and prevent temperature rise.

Which cooling system should be used in battery thermal management system?

The mainstream cooling system in the battery thermal management system is still the liquid cooling system, and the research on it is relatively mature, but the weight is great and the heat dissipation effect of the traditional cooling medium is poor, the research on cooling media and lightweight design are mainly inclined in the future.

What are the different types of battery thermal management methods?

Hwang et al. explored four common battery thermal management methods, namely air cooling, liquid cooling, phase change materials, and thermoelectric systems, and evaluated the advantages and disadvantages of each.

What is a battery management system coupled with liquid cooling and heat pipe?

Yuan et al. [103] proposed a battery management system coupled with liquid cooling and heat pipe. The coupling system was a battery liquid cooling structure composed of a cold plate and heat pipe, and the condensation section did not directly contact the cooling medium.

How does thermal management work in electric vehicle power batteries?

Huang et al. [61] developed a thermal management control for electric vehicle power batteries using eddy current tube cooling and heating technology. The thermal management system converts the kinetic energy of the vehicle into air pressure by recovering the braking energy of the electric vehicle, which can provide energy for thermal management.

What is a liquid based battery thermal management system?

In liquid-based battery thermal management systems, a chiller is required to cool water, which requires the use of a significant amount of energy. Liquid-based cooling systems are the most commonly used battery thermal management systems for electric and hybrid electric vehicles.
