How are EV batteries ranked?

New methods for ranking EV batteries by energy,volume,and thermal performance. Overall battery performance ranking depends heavily on project-specific constraints. Electric vehicle (EV) batteries can provide extended value beyond EV service if they are repurposed for a "second life" in electricity grid applications.

How do research papers describe battery performance?

During this review, it has been found that most of the research papers provide information, covering only one or very few parameters to describe the decrement of power in the battery, leaving aside a holistic and comprehensive study to critically evaluate the performance.

How are battery performance metrics evaluated?

Test results are evaluated based on six battery performance metrics in three key performance categories, including two energy metrics (usable energy capacity and charge-discharge energy efficiency), one volume metric (energy density), and three thermal metrics (average temperature rise, peak temperature rise, and cycle time).

How can EV battery performance scores be used for Energy Arbitrage?

The overall performance scores can be used to rank all EV battery samplesbased on the constraints of specific second-life energy arbitrage projects. This tool can aid developers in the selection of EV batteries for energy arbitrage and similar grid energy services such as peak shaving. 4.1. Energy

Are lithium-ion batteries a good power source for electric vehicles?

Lithium-ion batteries are the most prominent power source for electric vehicles. The continues use at different environmental conditions demand accurate electrical and mechanical functionality. Most of the research paper published provide information to describe these conditions covering only one or a very few parameters.

What are the parameters of a battery?

The state of the battery is mainly defined by two parameters: state of charge (SOC) and, state of health (SOH). Both parameters influence performance in the battery and are dependent on each other (Jossen et al., 1999).

Three reference vehicles (a City car, a Highway car and a Sport car) were conceptualized after performance requirements, with data on existing battery electric cars as a frame of reference. The acceleration performance, energy ...
