Well, without going through major electrical theory, the difference between chassis ground and grounding straight to the negative battery post is minimal as long as the chassis ground is good. All conductors of electricity have some resistance, copper doesn't have much, but over long lengths of copper wire you will see some resistance, especially if the wire ...

Hi. I want to build a strictly leisure battery bank with two 70Ah batteries and 2500watt inverter that will be used only for things like kettle, low power microwave, digital gadgets like phones and laptops, maybe cool box from time to time.

This is a smart device that can easily adjust the grounding strength. It is easy to use and can be connected to any grounded product. You only need to switch the knob to change the grounding strength of any grounded product. Multiple products can be connected to the smart device at the same time. No battery or power source is required. The knob is attached to the internal ...

Most of these systems employ a chassis ground from the negative side of the battery to the frame. Mostly to use the frame as a conductor although having the chassis ground (not earth grounded) has other advantages also. In these applications earth grounding is not practical and is almost never practiced.
