

Battery heat dissipation field analysis report

What are the heat dissipation characteristics of lithium-ion battery pack?

Before simulating the heat dissipation characteristics of lithium-ion battery pack, assumptions are made as follows: Air flow velocity is relatively small, and it is an incompressible fluid during the whole heat transfer phase of the battery pack.

Does battery pack have heat dissipation performance?

The research on the heat dissipation performance of the battery pack is the current research hotspot in the electric vehicle industry. In this paper, battery modules and battery pack are simplified to heat source and semi-closed chamber, respectively.

How does the heat dissipation performance of a semi closed chamber affect battery performance?

Therefore, the heat dissipation performance of the semi closed chamber which is based on air cooling can directly represent the temperature distribution of the battery pack as well as its performance.

What are the different types of heat dissipation methods for battery packs?

Currently, the heat dissipation methods for battery packs include air cooling , liquid cooling , phase change material cooling , heat pipe cooling , and popular coupling cooling . Among these methods, due to its high efficiency and low cost, liquid cooling was widely used by most enterprises.

Does temperature gradient affect heat dissipation performance of air-cooled battery pack?

Thermal flow fields of different air outlet modes were considered in this paper, and the results show that the heat dissipation performance of air-cooled battery pack increases with the improvement of the synergy degree between velocity field and temperature gradient field.

Does a battery thermal management model meet heat dissipation requirements?

The T_{max} of the battery module decreased by 6.84% from 40.94°C to 38.14°C and temperature mean square deviation decreased (TSD) by 62.13% from 1.69 to 0.64. Importantly, the battery thermal management model developed in this study successfully met heat dissipation requirements without significantly increasing pump energy consumption.
