

What is a tank battery?

The tank battery is the arrangement of storage and processing tanks, flow lines, and other equipment necessary to operate a well. Some tank batteries are connected to just one well, while others receive and process fluids from several different wells.

Are tank batteries connected to more than one well?

Some tank batteries are connected to just one well, while others receive and process fluids from several different wells. When a single tank battery receives from a few different wells, those wells will usually all be close together which means they are all producing similar amounts and types of fluids.

Do tank batteries need a circulation pump?

Just about every tank battery will need some sort of circulation pump. It can be one of a bunch of different kinds, and is used to move fluids from one vessel in the tank battery to another. Most tank batteries will require some sort of dike or firewall.

How does a tank battery work?

When a single tank battery receives from a few different wells, those wells will usually all be close together which means they are all producing similar amounts and types of fluids. The different vessels and equipment that make up the tank battery will be chosen to store and treat the products from those type of wells.

Do tank batteries need a dike or firewall?

Most tank batteries will require some sort of dike or firewall. These are required around vessels that are not pressurized, with fluids that are stored at atmospheric pressure. The firewall contains fluids in the case of leaks or other emergencies where oil may end up outside of a stock tank or other vessel.

How are batteries rated?

Most batteries are rated in Wh/kg, revealing how much energy a given weight can generate. Wh/l denotes watt-hours per liter. (See BU-105: Battery Definition) Batteries are custom-fit for a specific use, and manufacturers are well in tune with customer needs. Mobile phone and EV markets are examples of clever adaptations at opposite extremes.
