## Battery voltage and output power are inconsistent

Why is inconsistency a key factor affecting the performance of battery packs?

The inconsistency, which is cell to cell variations within battery packs, is a key factor influencing the performance of battery packs ,... The inconsistency not only affects the output power and energy of the battery pack, but also relates to the state of health and safety of the battery pack ,.

Does battery pack inconsistency affect output energy?

Therefore, the influence degree of the battery pack inconsistency on the output energy needs to be studied based on a battery pack inconsistency model, a newly built experimental platform with adjustable battery pack inconsistency parameters, and the method of multiple linear regression analysis. 1.2. Contributions of this work

What factors affect the output energy value of a battery pack?

Among the many inconsistency factors of the battery pack, the capacity, resistance and SOC of the cells in the battery pack have the greatest impact on the output energy value of the battery pack ,...

What causes battery inconsistency?

Specifically, differences in battery materials, manufacturing, and service conditions can cause battery inconsistencies. According to different principles, inconsistency evaluation methods can be summarized as statistical-based, machine learning-based, and information fusion-based methods.

When is a battery pack a serious inconsistency?

The battery pack is severe inconsistency when the standard deviation is more than 30%. It can be seen that the standard deviation of evaluation values is more than 30% after the four hundred cycles, which means the serious inconsistency. And the battery pack needs to be balanced or to be replaced with some individual cells. Fig. 9.

How does battery inconsistency vary in different cycle conditions?

In order to explore the battery inconsistency variation in different cycle conditions, the cycle plan is designed. Specifically, all cells are charged by the constant current-constant voltage (CC-CV) method and discharged at 2 C current to the lower cut-off voltage as a charge and discharge cycle, and one hundred cycles are a set of large cycles.
