How do you charge a capacitor?

Set up the circuit as shown in the diagram. Close the switch to charge the capacitor, record the voltage and current at time $t = 0$ and at 5 s intervals as the capacitor charges until about 120s have passed. This may be made easier by working in pairs. Repeat the experiment twice more and record the voltage and current for each time again.

How do you discharge a capacitor?

Discharging a capacitor: Consider the circuit shown in Figure 6.21. When switch S is closed, the capacitor C immediately charges to a maximum value given by $Q = CV$. As switch S is opened, the capacitor starts to discharge through the resistor R and the ammeter.

How does a series capacitor work?

In the case of circuit B, where an initially uncharged capacitor is connected in the circuit, the current also immediately rises to the same value, I , determined by $I = V/R$ but it then starts to decay away with time, eventually reaching zero. The series capacitor limits the way that current flows through the resistor.

How do you charge a capacitor with a data logger?

charging began (s), R is the resistance of the fixed resistor and C is the capacitance of the capacitor. 0 the initial current. The area under the I - t graph gives the charge stored by the capacitor. Connect both a voltage sensor and current sensor to a data logger. The stopwatch is no longer needed as the data logger has an internal timer.

What is a current-time graph of a capacitor?

Graphs of V (the p.d. across the capacitor) against t follow the same pattern as the graph of Q against t , because $Q = VC$ (from $Q = VC$). When current-time graphs are plotted, you should remember that current can change direction and will flow one way on charging the capacitor and in the other direction when the capacitor is discharging.

How do you measure a capacitor voltage?

You need to measure the capacitor voltage with an oscilloscope to best benefit from building this circuit. The capacitor will be fully charged up to supply voltage (5V in the diagram) if the switch hasn't been pressed for more than 5 seconds. Never short a large value capacitor, or one that is charged to a high voltage.

To charge a capacitor we make the circuit shown in Figure 37.5 with a constant EMF source. In the diagram, a capacitor of capacitance (C) is in series with an EMF source of voltage ($V_{\text{text{.}}}$) The resistance (R) is the total resistance ...
