

What is the impedance of a power factor compensation capacitor?

The impedance for a circuit with a power factor compensation capacitor is given by Equation 5, where  $X_C$  is capacitive reactance and is given by Equation 6. In most industries, a system of capacitors controlled by a power factor correction controller is installed for reactive power compensation.

How much power does a capacitor provide?

In theory capacitors could provide 100% of compensated reactive power required in a circuit, but in practice a power factor correction of between 95% and 98% (0.95 to 0.98) is usually sufficient. So using our coil from example no2 above, what value of capacitor is required to improve the power factor from 0.5 to 0.95.

Why is a capacitor used in a power factor correction system?

This aids in maintaining the voltage level in the system. The high inductive component of the starting current is reduced by the addition of capacitance during the starting period only. In this, it differs from applying capacitors for power factor correction.

What are capacitor based power factor correction circuits & PFC capacitors?

This post provides deeper look into capacitor based power factor correction circuits and power factor correction (PFC) capacitors. Some of the AC power consumed by inductive loads is used to maintain magnetic reversals due to phase shift between current and voltage.

How does a capacitor improve power factor?

A capacitor helps to improve the power factor by relieving the supply line of the reactive power. The capacitor achieves this by storing the magnetic reversal energy. Figure 7 shows an inductive load with a power factor correction capacitor. Figure 8 above illustrates the improvement in power factor when the capacitor is added to the circuit.

What factors should be considered when selecting capacitors for power factor correction?

Key variables to consider when selecting capacitors for power factor correction include load type, load constancy, load size, load capacity, method of utility billing, and load starting methods. Power factor correction capacitors are usually installed as banks of capacitors when substations or large facilities are involved.
