

Circuit diagram of 12 volt solar street light

What is a solar street light circuit diagram?

A basic solar street light circuit diagram consists of the following components: a solar panel, controller, battery, LED, and voltage regulator. Each component is essential for a working system. The solar panel is the most integral part of the system. It absorbs the energy from the sun and converts it into usable electricity.

What is a project report for a solar powered LED street light?

The document describes a project report for a solar powered LED street light with automatic intensity control. It includes a functional block diagram and explanations of the components, including a solar panel, charge controller circuit, rechargeable battery, voltage divider circuit, and Arduino UNO microcontroller.

How do solar street lights work?

Solar street lights are an excellent solution for areas with no access to reliable electricity. They are usually powered by solar panels, which gather energy from the sun and use it to charge a battery, which in turn powers the lights. But if you have a bit of technical know-how, you can build your own solar street lights.

How many volts does a solar charger use?

First, we use a 12V 2.5Ah battery and a 12V 2W LED. The LED consumes about 0.16A (from 2W/12V). At night, we need about 8 hours of light. So, the LED needs about 1.28A in total, or around 50% of the battery capacity. So it should be enough. Simplest solar charger circuit Second, during the day, we have about 5 to 8 hours to charge the battery.

How to build a solar panel circuit?

Let's look at the circuit wiring diagram below, which makes it easier for beginners to understand and build this circuit. Install the solar cell on the wooden plank and turn it towards the sunlight. Next, install all parts of the circuit under this solar panel. Connect the circuit to the battery and measure the battery's voltage.

What voltage does a 40 Watt Street light need?

Those can be dangerous for the battery! Referring to the 40 watt street light circuit diagram above, the panel voltage is regulated and stabilized to the required 14.4 volts by the IC LM 338. P3 is used for setting the output voltage to exactly 14.3 volts or somewhere near to it.
