#### What are the components of a DC power system?

The components of the dc power system addressed by this document include lead-acid and nickel-cadmium storage batteries, static battery chargers, and distribution equipment. Guidance in selecting the quantity and types of equipment, the equipment ratings, interconnections, instrumentation and protection is also provided.

### What is a Recommended Practice for a stationary DC power system?

Guidance in selecting the quantity and types of equipment, the equipment ratings, interconnections, instrumentation and protection is also provided. This recommendation is applicable for power generation, substation, and telecommunication applications. Scope: This recommended practice provides guidance for the design of stationary dc power systems.

### Can a BS 1363 plug be used on a DC system?

The standard specifically states products that are suitable for a.c., at voltages not exceeding 250 V r.m.s, and no d.c. ratings (or tests within the standard) are prescribed. BS 1363 plugs, sockets and accessories should not be usedon d.c. systems.

How can a common DC system be used in a building?

The use of d.c. distribution within buildings offers carbon/energy savings, and the integration of building services and information technology networks using a common d.c. system allows for the optimisation of space management and utilisation in buildings.

Do overcurrent protective devices have a minimum and maximum operating voltage?

It should be noted that overcurrent protective devices may have a minimum operating voltage in addition to a maximum operating voltage, which, if the source impedance is not insignificant in relation to the loop impedance, may result in the circuit protective device having to operate outside its intended voltage range.
