

Energy consumption benchmarking of lithium battery negative electrode materials

What is a lithium metal negative electrode?

Using a lithium metal negative electrode has the promise of both higher specific energy density cells and an environmentally more benign chemistry. One example is that the copper current collector, needed for a LIB, ought to be possible to eliminate, reducing the amount of inactive cell material.

What is the effective thermal conductivity of lithium-ion battery electrodes?

Burheim et al. [40] measured the effective thermal conductivity of lithium-ion battery electrodes; the experimental thermal conductivity results are within 0.5-1.1 W/(K·m) throughout the working lifetime of the electrodes. The present work obtains the anisotropic effective thermal conductivities in the graphite anode via LB modeling.

What happens if the cost of lithium metal is increased?

If the cost of lithium metal is reduced by 50%, the energy-optimised cells cost 8-10% less, and the power-optimised cells 18-22% less. On the other hand, if the cost of lithium metal is increased by 50%, the cost of the cells will increase by 10-11% for the energy-optimised cells, and by 18-22% for the power-optimised cells.

How does Li-foil thickness affect cell energy densities and cost per km?

As thinner Li-foils are possible for the electrochemical reactions, the Li-foil thickness is included in the sensitivity analysis and study how this affects the cell energy densities and cost per km. From the cell capacity, the amount of active cathode material needed (mAhg⁻¹ and Ah of cells) has been calculated.

According to the effects of irradiation temperature, dose and intensity on cylindrical lithium-ion batteries, Ma et al. [82] proposed an electrochemical irradiation model of irradiated electrode materials, so that lithium batteries working in extreme environments can better play their optimal performance. Researchers can use LTP technology ...

1 Introduction. Lithium-ion batteries, which utilize the reversible electrochemical reaction of materials, are currently being used as indispensable energy storage devices. [] One of the critical factors contributing to their widespread use is the significantly higher energy density of lithium-ion batteries compared to other energy storage devices. [] ...

Solid-state or all-solid-state batteries (ASSB) promise a significant increase in energy density compared to conventional lithium-ion batteries. This is why they are considered the future energy storage system for electromobility. However, there is no standardized protocol for the validation of solid-state battery cells in battery research.

Energy consumption benchmarking of lithium battery negative electrode materials

In the search for high-energy density Li-ion batteries, there are two battery components that must be optimized: cathode and anode. Currently available cathode materials for Li-ion batteries, such as $\text{LiNi}_{1/3}\text{Mn}_{1/3}\text{Co}_{1/3}\text{O}_2$ (NMC) or $\text{LiNi}_{0.8}\text{Co}_{0.8}\text{Al}_{0.05}\text{O}_2$ (NCA) can provide practical specific capacity values (C_{sp}) of 170-200 mAh g^{-1} , which produces ...

The Ragone plots demonstrate that LiPF_6 electrolytes in lithium-ion batteries and NaPF_6 electrolytes in sodium-ion batteries both exhibit superior specific energy densities compared to their KOH and NaClO_4 counterparts, respectively. The work presented in this paper encourages researchers to select alternate electrolytes and electrodes for lithium-ion and ...

A process model is developed to determine the material and energy flows of a general lithium-ion battery cell manufacturing process. The model is flexible for different battery chemistries,...

The framework is employed to propose and investigate roll-to-roll direct contact pre-lithiation on a large production scale as a promising solution to address active lithium loss ...

High-throughput electrode processing is needed to meet lithium-ion battery market demand. This Review discusses the benefits and drawbacks of advanced electrode ...

NiCo_2O_4 has been successfully used as the negative electrode of a 3 V lithium-ion battery. It should be noted that the potential applicability of this anode material in commercial lithium-ion batteries requires a careful selection of the cathode material with sufficiently high voltage, e.g. by using 5 V cathodes $\text{LiNi}_{0.5}\text{Mn}_{1.5}\text{O}_4$ as ...

Since the Industrial Revolution, the rapid economic growth has been closely linked to substantial energy consumption. The current global energy issue has become a significant constraint on both economic and sustainable development [1]. Lithium-ion batteries, known for their high capacity, relatively stable electrochemical performance, and enhanced ...
