## SOLAR PRO. Energy storage module optimization setting parameters

Which energy storage system parameters were used in the optimization algorithm?

The energy storage system parameters selected by the key parameter analysis in the previous section were used as the variables searched when the optimization algorithm solves problems. The IGA and IPSO had the same range of variables searched and the interval.

Why do energy storage systems need a good parameter selection process?

Improper parameters will produce estimation results that are not informative, and the utilities may make wrong decisions. To avoid this problem, this study designed the process to find suitable parameters for real energy storage systems.

What is the peak regulating effect of energy storage after parameter optimization?

According to the generator output curve and energy storage output curve, the peak regulating effect of energy storage after parameter optimization is better than that without parameter optimization.

What are the parameters of energy storage device?

The parameters of the energy storage device are set as follows: P I N I T = 0, T A = T B = T C = T D? = 0. 5 s, power control gain K D P = 1, speed control gain K D o = 1.

What are the initial parameters of the WECC energy storage system?

The initial values of the universal model parameters of the WECC energy storage system selected in this study were adjusted based on the manufacturer's preset parameters. There were two classes of target parameters of the key parameter analysis: the initial value of one class was not 0, and the initial value of the other class was 0.

What is sorption thermal energy storage optimization?

The optimization sought to identify the best sorption thermal energy storage size and system operating behaviorthat optimized annual revenues from selling organic Rankine cycle based power to energy markets.
