SOLAR PRO. Energy storage product disassembly plan design

Is disassembly planning optimization important in achieving sustainable product life cycle?

Given the importance of disassembly planning optimization in achieving effective sustainable product life cycle, this paper describes a conceptual framework that aims to efficiently inject different disassembly planning research that has been conducted independently in the past into different stages of a product life cycle.

What is dynamic disassembly planning?

To address uncertainties due to EOL conditions of the products, dynamic disassembly planning methods that take into account real time conditions, such as broken parts and severely corroded components, have emerged as a challenging field to assist human operators in retrieving the core efficiently in real life conditions.

What are the different types of Product disassembly?

Notably, these end-of-life (EOL) operations as well as routine maintenance of the products require disassembly. Product disassembly is formally defined as the systematic separation of components. It can be categorized into several types, namely, destructive or non-destructive and partial (selective) or complete (full) disassembly.

What is the difference between disassembly planning and sequencing?

Disassembly planning focuses on the components and product levels to generate the most optimal disassembly route of a specific product. Meanwhile, disassembly sequencing focuses on the task planning and inventory flow to systematically disassemble batches of products.

What are the different approaches in disassembly research?

3. Approaches and Challenges in Disassembly Planning Current approaches in disassembly research can be divided into disassembly planning and disassembly sequencing. Disassembly planning focuses on the components and product levels to generate the most optimal disassembly route of a specific product.

What is the difference between product assembly and disassembly?

Unlike product assembly that occurs during the manufacturing stage, disassembly operation is performed after a product launch and is often considered as a non-value added operation; hence, the companies or remanufacturers have to be incentivized to perform disassembly.
