What is the electrical system of a motorhome?

The electrical system of a motorhome can be quite complex, involving 12 volt DC battery power as well as 120 volt AC power. It's unavoidable that issues will occur from time to time but many of these can easily be corrected by the RV owner with a basic understanding of electricity.

How much voltage does an RV generator use?

If you crank up your RV generator or plug into shore power, your voltage will go up to 14.0 - 14.5 volts, even when your battery is seriously depleted. If you turn on a big load like the microwave (if you have a big inverter that will power it), your voltage will dive down into the 11.5-11.8 volt range, even on fully charged batteries.

Does a motorhome have a 12 volt system?

The two 12 volt systems are kept separate so you don't suck the power from the starter battery when you are parked up so the engine battery is usually protected from discharge while you are using power in the motorhome. This usually means that there are two fuse boxes in the motorhome (at least there is in ours, newer models may be different).

What are the basics of RV electrical systems?

Understanding the basics of RV electrical systems is important to every RV owner. The electrical system of a motorhome can be quite complex, involving 12 volt DC battery power as well as 120 volt AC power.

What kind of batteries do RV owners need?

RV owners need to take proper care of their motorhome batteries, which power the electrical systems in an RV like lights and appliances. These deep cycle batteries come in various types such as lead-acid, AGM or lithium ion based.

Why do motorhomes need 12V batteries?

These 12v batteries are pivotal in providing a reliable and safe power source while you're on the move or parked without access to mains electricity. The 12v power system in a motorhome is designed to supply electricity to the vehicle's essential features, such as lighting, water pumps, and the fridge, among other low voltage appliances.

Check with multimeter the battery no load voltage when fully charged should be around 12.8 ish and this should hold without much of a drop when left standing for a week. If it does not hold voltage then as suggested a new battery is probably needed. Digital mutimeters are cheap enough on Amazon and most are plenty accurate enough for the purpose.
