In-car solar automatic temperature control device

How does a car temperature control system work?

These temperature control systems take many different factors into consideration when setting and keeping the desired temperature inside the cabin of a car. Their systems use information from inside and outside of the car and look at the overall efficiency of the car and adjust accordingly.

What are automatic temperature control systems (ATC)?

Automatic Temperature Controls (ATC) are complex systems incorporated into many newer car models. These temperature control systems take many different factors into consideration when setting and keeping the desired temperature inside the cabin of a car.

How does a car humidity sensor work?

Additionally, it also helps manage a comfortable climate within the car. Similar to the temperature control systems, some humidity sensors use infrared sensors to measure the windshield and side window temperatures for further climate regulation inside of the cabin.

Do cars use infrared sensors?

Although slightly more uncommon, some cars may use infrared sensorsplaced on a dashboard to track the cars body temperature. All of these different sensors and components are used in combination with each other to keep the car's cabin and its passengers at the ideal temperature.

How does a solar load sensor work?

It uses all of its different sensors placed in and around the car to keep its temperature in check. Solar load sensors are incorporated into many ATC systems. These sensors are responsible for increasing or decreasing the car's temperature and cooling systems when the cabin is in direct sunlight.

What sensors do ATC systems use?

ATC systems use many different sensors, internally and externally, on a car. For instance, it uses ambient air temperature sensors, humidity sensors, pressure sensors, interior temperature sensors, outlet duct/evaporator sensors, sunload sensors, and blend door position sensors.

The device employs a control scheme that combines photoelectric tracking with sun path trajectory tracking to achieve high-precision solar tracking. Experimental results show that this device improves power generation by 34.8% compared to fixed solar power generation systems.
