The sodium-ion batteries are having high demand to replace Li-ion batteries because of abundant source of availability. Lithium-ion batteries exhibit high energy storage capacity than Na-ion batteries. The increasing demand of Lithium-ion batteries led young researchers to find alternative batteries for upcoming generations.

Equivalent circuit method is the most widely used methodology in dynamic modeling of lithium-ion battery. An equivalent circuit with second-order RC network is used to model lithium-ion battery, and a limited memory recursive least square with variable forgetting factor (VFF-LMRLS) is proposed to identify the model parameters in this paper.

Equivalent circuit modeling has emerged as an invaluable approach to fulfill this requirement by offering a simplified yet effective representation of Li-ion batteries. In ...
