What is a lithium titanate battery?

A lithium-titanate battery is a modified lithium-ion batterythat uses lithium-titanate nanocrystals, instead of carbon, on the surface of its anode. This gives the anode a surface area of about 100 square meters per gram, compared with 3 square meters per gram for carbon, allowing electrons to enter and leave the anode quickly.

Are lithium titanate batteries a good choice for electric vehicles?

Battery electric vehicles and hybrid electric vehicles demand batteries that can store large amounts of energy in addition to accommodating large charge and discharge currents without compromising battery life. Lithium-titanate batteries have recently become an attractive optionfor this application.

Do lithium titanate cells have good thermal management?

Additional benefits from good thermal management of lithium-titanate cells include improved electrochemical performance, better charge acceptance, higher power and energy capacity, and improved cycle life. Preliminary tests revealed that the cells do not generate heat evenly throughout their volume.

What are the disadvantages of lithium titanate batteries?

A disadvantage of lithium-titanate batteries is their lower inherent voltage(2.4 V),which leads to a lower specific energy (about 30-110 Wh/kg) than conventional lithium-ion battery technologies,which have an inherent voltage of 3.7 V. Some lithium-titanate batteries,however,have an volumetric energy density of up to 177 Wh/L.

How long do lithium titanate batteries last?

Recent advances in Li-ion technology have led to the development of lithium-titanate batteries which, according to one manufacturer, offer higher energy density, more than 2000 cycles (at 100% depth-of-discharge), and a life expectancy of 10-15 years.

What are the advantages of lithium titanate battery?

Using Li4Ti5O12 as its anode instead of graphite, the lithium titanate battery has the inherent advantages in rate characteristics, cycle life and chemical stability, which is more suitable for rail transit application. As an indicator of battery available energy, state of energy (SOE) is of great importance to estimate.

on suppressing the lithium titanate battery fire, an experimental system was designed and built to perform the extinguishing test. The lithium titanate battery (50 Ah, 2.3 V) with diameter of 66 mm and length of 260 mm was used. A 5 kW electric hea-ter was set under the battery to trigger the thermal runaway of the battery. When the
