# Luminescent Materials for Energy Storage 2024

What are luminescent materials?

This Special Issue covers various luminescent materials that are currently a focus of research, such as carbon dots, perovskites, metal complexes, lanthanide phosphors, and luminescent hybrid materials, exploring their photophysical properties and achieving promising applications in chemical sensing and photocatalysis.

#### What are the different types of luminescent nanomaterials?

The luminescent nanomaterials are further classified into three types: downshifting luminescent materials, upconverting luminescent materials, and quantum dot materials, based on their luminescence emission mechanisms .

Are rare-earth-doped luminescent materials promising for optical data storage?

In addition, rare-earth-doped luminescent materials are promising for optical data storage[23,,,]. By doping various rare-earth ions with up-conversion and downshifting luminescent properties in the same matrix, color-tunable multi-mode emission at different excitation wavelengths can be achieved [,,,].

What is optical storage based on rare earth luminescence?

Optical storage of informationbased on rare earth luminescence is also available in many ways, not only for writing and reading functions, but also for erasing and rewriting, with the advantage of reuse.

How do luminescent hybrid materials show superior photophysical properties?

Luminescent hybrid materials show superior photophysical properties by integrating the properties of different structural units. Ito's group synthesized inorganic-organic hybrid phosphors by means of the hybridization of Eu 3+-containing polyoxometalate anions with bolaamphiphile surfactants.

#### What is rare earth luminescent anti-counterfeiting & optical information storage?

In recent years, research on rare earth luminescent anti-counterfeiting and optical information storage has made great progress. Authenticity can be determined through the static or dynamic changes in color of luminescent patterns under light excitation, or under the stimulation of other factors.

Persistent luminescence is an optical process by which luminescent materials emit light for minutes or even hours after excitation ceases. Its mystical properties, first documented in the early ...

Considering the enhanced energy storage performance in filled TB Sr 2 NaNb 5 O 15 niobates achieved through component regulation to induce relaxation, we propose that simultaneous improvements in energy storage performance and luminescent properties can be achieved by co-doping in both A and B sites of TB structure. Moreover, the relaxation ...

## SOLAR PRO. Luminescent Materials for Energy Storage 2024

Energy transfer from luminescent materials to dye molecules in DSSCs primarily occurs through Förster resonance energy transfer (FRET). FRET is a non-radiative process where energy is transferred from a donor ...

DOI: 10.1016/j.materresbull.2024.112801 Corpus ID: 268651518; Optical anti-counterfeiting and information storage based on Rare-earth-doped luminescent materials @article{Zhang2024OpticalAA, title={Optical anti-counterfeiting and information storage based on Rare-earth-doped luminescent materials}, author={Chengyun Zhang and Qingxin Yin and ...

Introduction Persistent luminescence (PersL), also called "afterglow", has been known for a long time. 1-3 It is a phenomenon of materials showing long-lasting luminescence, typically from minutes to hours after the ...

The present work overviews latest advances in energy transfer for generating and modulating CPL, involving small organic molecules, polymers, metal complexes, liquid ...

Deep-trap persistent luminescent (PersL) materials with enriched traps, which allow signals to quickly write-in and read-out with low-energy consumption, are one of the most promising materials for information ...

Persistent luminescent materials exhibit delayed and long-lasting luminescence due to the temporary storage of optical energy in engineered structural defects. Standard characterization methods do not provide a universal comparison of phosphor performance, hindering the evaluation of the efficiency of the various processes involved in afterglow.

Rare-earth-doped materials with abundant electronic energy levels are capable of emitting bright multicolor radiation and are therefore considered irreplaceable candidates for optical anti-counterfeiting and optical information storage. This review summarizes recent theoretical and experimental advances of optical anti-counterfeiting and optical information storage based on ...

The 4th International Conference on Energy Material and Energy Technology (EMET 2024) will be held in Wyndham Garden Haikou Meilan Hotel, Haikou, China during November 18-20, 2024. ... Luminescent, Display, and Lighting Materials and Devices Session Chair: Prof. Chunmiao Han, Heilongjiang University, ... Energy Storage Materials Sights of ...
