SOLAR PRO. Photothermal energy storage power generation test

What is solar to hydrogen-electricity and thermal storage system (sthet)?

Solar to hydrogen-electricity and thermal storage system (STHET) is proposed. Hydrogen production in STHET is improved by recycling scattered light. Low-grade waste heat is converted into electrical energy by flexible TEGs. STHET can achieve continuous power generation by self-thermal storage capability.

Why do photothermal catalytic systems have a certain heat storage capacity?

The photothermal catalytic system has a certain heat storage capacity because it's a solid-liquid phase system including liquid water. In STHET, TEG can recycle the scattered light and therefore enhances the photothermal effect.

Can photothermal catalytic hydrogen production be achieved in the dark?

It is worth mentioning that the novel integrated system (STHET) is the first time proposed to achieve photothermal catalytic hydrogen production coupled with low-grade waste heat utilization by flexible TEG and thermal storage capacity for continuous power generation in the dark. Fig. 1.

Can a novel integrated system produce photothermal catalytic hydrogen?

Conclusion In summary, a novel integrated system (STHET) is firstly proposed to achieve photothermal catalytic hydrogen production coupled with low-grade waste heat utilization by flexible TEGs and thermal storage capacity of liquid phase system for continuous power generation in the dark.

Can sthet achieve continuous power generation by self-thermal storage capability?

STHET can achieve continuous power generation by self-thermal storage capability. Photothermal catalytic water splitting is a potential way to produce renewable hydrogen. However, low-grade heat converted from solar energy in the photochemical process is inevitably dissipated to the environment and often wasted.

Can photothermal catalysis improve the efficiency of solar energy utilization?

It would be a useful technology to increase the efficiency of solar energy utilization integrating photothermal catalysis and TEG waste heat recovery for hydrogen-electricity co-generation. On the other hand, solar energy is low density, instability, and intermittency.

The project aims to develop, test and verify effective thermal energy storage (TES) systems for Stirling engine based power generation, fueled by concentrated solar irradiation (CSP). With an adequate thermal storage, this type of power plants produces cost-effective solar electricity below \$100 / MWh, around the clock and can act as base load and load balancing source to the grid.

- *Higher energy density compared to current salts (> 300-756 MJ/m3) - Lower power generation cost compared to current salts (target DOE 2020 goal of Thermal Energy Storage(TES) cost < \$15/kWh thermal with > 93% round trip efficiency) 2. Major Accomplishments in this Year Experimental Project Overview o

This showcases the efficacy of the textile-based MoS 2 /cotton photothermal evaporator for continuous and stable vapor generation of 1.38 kg/m 2 /h alongside the simultaneous salt harvesting and electric power generation of 0.535 V. Peng et al. [40] incorporated MXene nanosheets into a cotton textile to generate freshwater and electric power.
