

if the laptop can do that, then technically it would work. but its not a guarantee because the power board of the laptop would have to accept 11.1, which it probably would to be honest now that i think about it. it likley can operate over a range of input voltages and 11.1 is ...

I have a Dell Inspiron 15-7569 and have really liked it. I have not had it that long, but long enough the warranty expired. Issue: o Getting this message when booting up "Alert! The AC power adapter wattage and type cannot be determined. The battery may not charge. The system will adjust the performance to match the power available."

I replaced the motherboard with a more powerful one (basically same board but has a SATA connector instead of MMC chip, and i7 quad-core) but i'm still using the same AC adapter. New board's BIOS says it needs 45W, and the adapter says 45W on it. I also tried both female power sockets which connect to the motherboard.

The center pin is required to complete the battery charge circuit -- the usual cause of an adapter recognition failure is either a bad plug on the adapter or a bad jack inside ...

Power (system information) shows AC power at 15w. I also tried a 65w AC adapter from Lenovo and even if it recognises the actual power output, the same message appears when clicked on the battery: battery is not charging. Is this how these MBA computers work? Do they only charge using the original adapters?
