

Can a hybrid DC circuit breaker reduce bipolar short-circuit current?

The bipolar short-circuit fault is one of the most severe types of DC side faults. It can cause a current surge, which affects the safe operation of a system. Therefore, this paper proposes a new type of hybrid DC circuit breaker (DCCB) to realize the rapid suppression of bipolar short-circuit current.

What is isolating DC bipolar short-circuit fault?

Isolating DC bipolar short-circuit fault is one of the difficulties faced by the flexible DC distribution system. This study aims to the hybrid modular multi-level converter (MMC). Firstly, the fault...

What is a bipolar short-circuit fault?

A bipolar short-circuit fault occurred at 0.4 s. When the fault current is determined to be twice that under normal operation, the SM is triggered and locked. The DC side voltage decays rapidly after the fault, as shown in Fig. 13 a. Similarly, as shown in Fig. 13 b, the current of the DC transmission line surges after 0.4 s.

Can a hybrid DCCB solve a bipolar short-circuit fault?

The blocking state of the MMC SMs is set to double the DC bus voltage. The short-circuit fault response of the Hybrid DCCB is set to 4 ms, and the fault type determination time is set to 0.2 s. The hybrid DCCB proposed in this paper can effectively solve the over-current problem caused by bipolar short-circuit faults of the HVDC transmission line.

Can a hybrid modular multi-level converter isolate DC bipolar short-circuit fault?

Isolating DC bipolar short-circuit fault is one of the difficulties faced by the flexible DC distribution system. This study aims to the hybrid modular multi-level converter (MMC). Firstly, the fault-blocking mechanism of a hybrid MMC is analysed.

How to isolate a bipolar short-circuit fault in MMC-LVDC?

Effectively isolating the short-circuit fault of the bipolar short-circuit on the DC side is a major challenge for the development of MMC-LVDC engineering. Isolating the fault through the converter itself is an ideal solution.

A polarized capacitor is destroyed from negative voltage because it has a built in diode that can flow current with negative voltage and when that happen it heats up and eventually explodes. ...

This paper describes the fault characteristics of power electronic transformer (PET) based on modular multilevel converter (MMC). The bipolar short-circuit fault on MV DC side is analyzed. ...
