

What are KNK capacitors used for?

The KNK capacitors are used for power factor correction of inductive consumers (transformers, electric motors, rectifiers) in industrial networks for voltages up to 690 V. Low voltage power factor correction capacitors can achieve savings by lowering power factor, reduced system losses.

Which capacitors should be used in a 400 volt distribution network?

We recommend using capacitors with higher nominal voltage than the nominal voltage of the distribution network. In a 400 V distribution network, we recommend capacitors with a nominal voltage of 440 V and capacitors with a nominal voltage of 480 V for detuned power factor correction with reactors.

What causes a low voltage capacitor?

This effect may be caused by the usage of non-linear devices (generation of higher harmonics), low short-circuit power of voltage sources (voltage fluctuation), etc. We recommend using capacitors with higher nominal voltage than the nominal voltage of the distribution network.

Can a power capacitor cause resonant circuit?

Systems with higher harmonics content may be sensitive to create resonant circuit between power capacitors and inductance of a transformer and may cause damage of an electrical system. The solution is to use detuned PFC which combines power capacitors with detuning reactors.

What is DC link & KNK capacitor?

DC link is suitable for Automotive (HEV/EV/EV charging stations), industrial inverter/converters, wind and solar power plants. The KNK capacitors are used for power factor correction of inductive consumers (transformers, electric motors, rectifiers) in industrial networks for voltages up to 690 V.

What is KLV1211 capacitor?

KLV1211 capacitor is based on construction of all-film capacitor sections, folding foil edge design, improved electrical and mechanical connections between sections and impregnation with ... Metallized polypropylene film capacitors KNB1540 RFI Class X1 have long life expectancy and they can withstand peak pulse voltage in service up to 4.0 kV.

These caps are most likely at the output of a switching power supply (please check). In this case, you will have to use low-ESR (or low-Z) models rated for this use. Consider Panasonic FC-FM-FR, Rubycon ZL, for example, but do not use "general purpose" caps in a low-Z position. Also, please make sure the capacitors fit in the holes.
