

# The research and development direction of new energy lithium batteries

Are lithium-ion batteries the future of battery technology?

Conclusive summary and perspective Lithium-ion batteries are considered to remain the battery technology of choice for the near-to mid-term future and it is anticipated that significant to substantial further improvement is possible.

Which cathode material can raise the energy density of lithium-ion battery?

Among the above cathode materials, the sulfur-based cathode material can raise the energy density of lithium-ion battery to a new level, which is the most promising cathode material for the development of high-energy density lithium batteries in addition to high-voltage lithium cobaltate and high-nickel cathode materials.

How to improve the energy density of lithium batteries?

Strategies such as improving the active material of the cathode, improving the specific capacity of the cathode/anode material, developing lithium metal anode/anode-free lithium batteries, using solid-state electrolytes and developing new energy storage systems have been used in the research of improving the energy density of lithium batteries.

How did lithium ion battery technology start?

The breakthrough of the lithium-ion battery technology was triggered by the substitution of lithium metal as an anode active material by carbonaceous compounds, nowadays mostly graphite. Several comprehensive reviews partly or entirely focusing on graphite are available [28, ...,].

How to calculate energy density of lithium secondary batteries?

This is the calculation formula of energy density of lithium secondary batteries: Energy density ( $\text{Wh kg}^{-1}$ ) =  $\frac{Q \times V}{M}$ . Where M is the total mass of the battery, V is the working voltage of the positive electrode material, and Q is the capacity of the battery.

Can a 3D architecture improve lithium ion battery density and spatial utilization?

Finally, it should be mentioned that several investigators are studying the possibility of 3D architecture of lithium ion battery structures including porous or expanded metal collectors. This would help to increase battery density and spatial utilization if production friendly concepts are developed. A typical anode study is referenced below. 66

Development high energy density alkali metal batteries (such as sodium, magnesium and zinc batteries) based on PIL-based polymer electrolytes, especially high energy density lithium metal batteries with high safety and long cycle life.

## The research and development direction of new energy lithium batteries

The development and utilization of new energy typically require efficient energy conversion storage systems, ... (4.5 V or even 4.6 V) without losing capacity has become a major research direction for lithium cobalt oxide. ... With the continuous development of lithium-ion battery cathodes, the nickel content in ternary materials has gradually ...

By comparing lithium-iron phosphate batteries with ternary lithium-ion batteries, the medium and long-term development directions of lithium-ion batteries are put forward. And the research products of different development directions ...

Research into and commercialization of these new battery chemistries is rapidly advancing, and we can expect to see even more green technologies come to market. Other battery types in the "next generation" category include zinc-ion and zinc-air batteries, aluminum- or magnesium-ion batteries, and sodium- and lithium-sulfur batteries.

Key performance indicators for lithium-ion battery research and development efforts in the mid- and long-term future, estimated based on the work and studies discussed ...

The diverse directions in which research and development on ambient temperature secondary lithium batteries is proceeding are discussed. The state-of-the-art in liquid electrolyte-based systems containing Li metal as the anode can be described in terms of the various AA-size cells developed; they are capable of 250-300 full depth of discharge cycles, ...

The lithium binding free energy of the M14C4-TPFOS was 90 ... which leads to poor recycling. Therefore, it is the development direction of LIS future research to solve the problems of granulation and dissolution loss of LIS, so that it can effectively realize industrial application. ... which is a brand-new lithium battery material [137]. The ...

Focusing on ternary lithium ion battery, all-solid-state lithium ion battery, anode material, lithium hexafluorophosphate electrolyte and diaphragm materials, this paper describes the...

Governments design and implement policies to achieve a variety of goals, but perhaps none are as pressing as shifting national economies away from non-renewable fuels and towards more sustainable, ...

Development and analysis of a new cylindrical lithium-ion battery thermal management system Ya-Song Sun, born in 1986, is currently an associate professor at School of Power and Energy ...

The R& D trend is coordinate with the time of basic national policy of new energy vehicles, therefore the policy plays an important role in promoting the development of new energy vehicle battery technology. Fig.4. The overall R& D trend of ...
