How does a photovoltaic cell work?

**Photovoltaic Cell Defined:** A photovoltaic cell, also known as a solar cell, is defined as a device that converts light into electricity using the photovoltaic effect. **Working Principle:** The solar cell working principle involves converting light energy into electrical energy by separating light-induced charge carriers within a semiconductor.

What is the working principle of a photovoltaic cell?

**Working principle of Photovoltaic Cell** is similar to that of a diode. In PV cell, when light whose energy ( $h\nu$ ) is greater than the band gap of the semiconductor used, the light get trapped and used to produce current.

How do solar cells work?

**Working Principle:** The working of solar cells involves light photons creating electron-hole pairs at the p-n junction, generating a voltage capable of driving a current across a connected load.

What is the working principle of a solar cell?

**Working Principle:** The solar cell working principle involves converting light energy into electrical energy by separating light-induced charge carriers within a semiconductor. **Role of Semiconductors:** Semiconductors like silicon are crucial because their properties can be modified to create free electrons or holes that carry electric current.
