What is the voltage range of a PC power supply?

Greatly varies depending on what Power Supply it has inside. Nowadays most PC power supplies have active PFC meaning they work dynamically within a range of voltages, that will usually be between 100-240V, but could be 90-250 or 110-230 or something else. really depends on the specific PSU you have.

What is the operating range of a power supply?

It is also important to be aware of the difference between "operating range" and "operating power range". Many manufacturers list the "operating range" for their power supplies as -20 to 70°C, even though the 40°C design does not provide power above 49°C.
