SOLAR PRO. Why does the solar solenoid valve break

Why is my solenoid valve leaking?

While relatively simple, solenoid valves can encounter issues like not opening/closing properly, leaking, or overheating. Another common issue is a too-low differential pressure for indirect operated solenoid valves. These issues often stem from debris, damaged parts, or electrical problems.

Why is my solenoid valve not working?

Another common issue is a too-low differential pressure for indirect operated solenoid valves. These issues often stem from debris, damaged parts, or electrical problems. Fixes include cleaning, replacing damaged components, and repairing electrical or cooling systems. View our online selection of solenoid valve products!

What causes a solenoid coil to burn out?

When servicing a solenoid coil, switch off the power to avoid causing it to burn out. Possible causes include lack of power in the solenoid coil, burnt coil, wrong voltage, pressure differences (too high or too low), and dirt of the membrane, valve seat, or tube. It can also be due to a vital part of the solenoid valve missing or being damaged.

What happens if a pilot solenoid valve is damaged?

In case of damage, such as torn diaphragm for pilot solenoid valves, replace the affected part. Install a missing component. This problem can result from inadequate pressure, damaged components such as the armature and tube, dirt on the diaphragm, valve seat, or tube, corrosion, and missing parts.

Why is my solenoid valve burning?

There are several causes of burnt coil in a solenoid valve. They include wrong voltage, a short circuit, dirt or damage in the moving parts such as the plunger, and media that's too hot. Some coil types are more prone to burning and the problem could have been caused by the wrong choice.

What happens if a solenoid valve is over pressure?

Exceeding the pressure rating of the solenoid valve can cause damage to the valve components. Tears in the diaphragm are usually an indication of over pressure. In extreme cases excessive pressure can cause damage to the valve body and armature tube assembly.
