Working principle of solar power supply control circuit

How does a solar charge controller work?

There is a switch between the solar panel and the battery and another switch between the battery and to load. Besides, it senses the battery voltage and panel presence. That's it in a very simple way. Check this block diagram of the Solar Charge Controller circuit. Here SW is the switch.

Why do we need a solar power controller?

In a solar power system,energy is harvested from sunlight and stored in a battery; then,the battery gives us power backup when required. This is very simple. But the problem is,each battery has a limit of taking charge and being discharged. That is why we need a controller to control both the charge and discharge limit.

What is a solar charge and discharge controller?

The diagram below shows the working principle of the most basic solar charge and discharge controller. The system consists of a PV module, battery, controller circuit, and load. Switch 1 and Switch 2 are the charging switch and the discharging switch, respectively.

Do solar panels need a PWM charge controller?

PWM (pulse-width modulation) charge controllers depend on older,less reliable hardware and enable you to adjust the solar panel's voltage to the battery voltage. E.g.,if you were to run a nominal 12-volt solar panel through a PWM charging controller,you need a 12-volt battery bank.

How to choose a solar charge controller?

A charge controller must be capable of handling this power output without being overloaded. Therefore, it's essential to tally the combined wattage of all solar panels in the system and choose a controller with a corresponding or higher wattage rating.

What is the difference between PWM and MPPT solar charge controllers?

MPPT controllers can extract up to 30% more powerfrom the solar panels compared to PWM controllers,making them an ideal choice for larger installations or systems where maximizing energy harvest is critical. Both PWM and MPPT solar charge controllers offer distinct advantages tailored to different system requirements and budgets.
